

MTR adopts Single Sign-On and Password Management

While their history nears the century mark, MTR is a food enterprise located in India. Originating from Bangalore as sole inventors for South Indian breakfast MTR is now a well-known face representing South Indian delicacies across tourist destinations like Singapore, Dubai, Muscat, and more. Starting from a simple Coffee Shop to becoming pioneers of authentic vegetarian food they have certainly come a long way. Now, being one among the Fortune Next 500 (India's Top Midsize) company for 2016 with worth over 7 Billion MTR stands tall as the Indian Heritage brand around the globe.

Using multiple directory stores such as Active Directory and Open LDAP made it difficult for MTR to manage multiple application logins and passwords both for internal and external employees while also maintaining audit and IT password policies. MTR was looking for a single solution that could integrate with the Active Directory as well as to their alternate directory service Open LDAP for employees registered outside the Active Directory. Ilantus Single Sign-On and Password Management solution was configured to work for both with AD and Open LDAP enabling single login experience across different domains and devices along with self-password reset and synchronization to all connected applications.

India's Leading Food Enterprise simplifies complex Active Directory and Open LDAP business
